

GET READY FOR THE FUTURE OF SIMULATION

Thank you for purchasing the obp e-Sports Pedal System! Over a decade of proven “real-world” motorsport winning engineering and expertise has been packaged into our products ready for you to use.

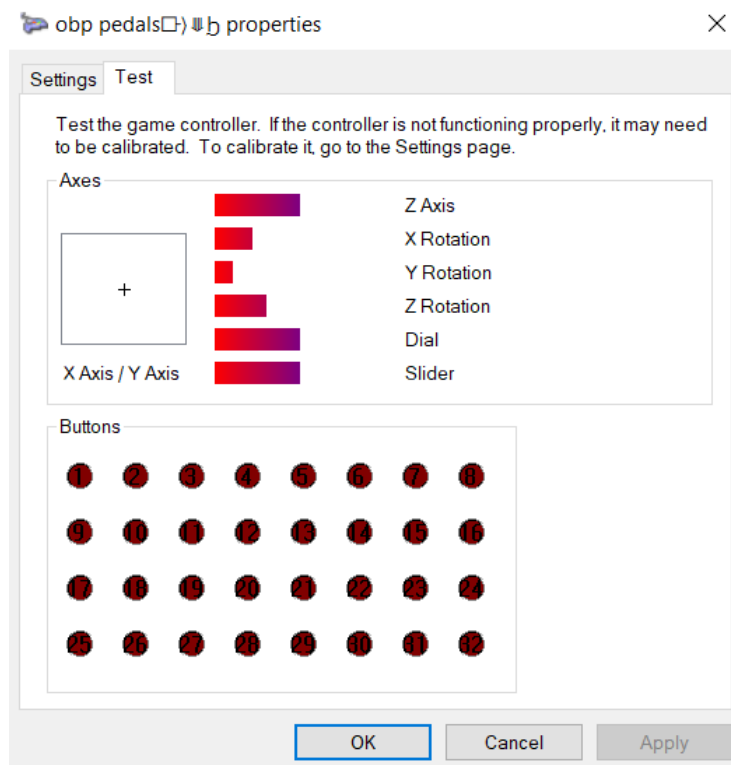

We highly recommend you calibrating the pedals on DIView, even after calibrating it on Windows, this will give you a more precise and refined pedal functionality.

Please follow the below steps to calibrate your pedals via Windows:

1. Insert the USB Adapter into an available USB port on your PC with the RJ45 side going into the back of the pedals
2. Windows will automatically download the required drivers
3. In the Search bar on Windows, type joy.cpl and click ENTER. The game controller panel will appear and you will see ‘obp pedals’ as an option.

4. Make sure the obp pedals controller is selected and click 'Properties', you will be taken to a test panel.

5. Fully depress each pedal and you should see each rotation respond on the window, if each pedal responds then windows has successfully installed the drivers and the pedal data is being received by the PC.
6. If the PC is not responding to the pedals being pushed then you may need to go to Settings > Calibrate and simply re-calibrate the pedals by fully depressing each pedal on their correct Axis.

X Axis: Clutch

Y Axis: Brake

Z Axis: Accelerator

Please note that the brake pedal must be successfully bled for it to correctly work.

In Game Set-Up

Open Game

Select Inputs for Throttle, Brake and Clutch by depressing each Individual Pedal. *(Please refer to specific game instruction manuals for further information).*

YOU ARE NOW READY TO RACE, GOOD LUCK AND HAVE FUN!
